Visible Agile - Concept

Necessity: One of the three pillars of Scrum theory is Transparency – Make the truth visible to all. The concept of VisibleAgile is derived from here.

Current Problem: Most of the times the true status of project progress is known only to the team. This data is then collected by respective project managers and program managers. Based on their interpretation they re-present to the leadership. This presentation may not always reflect the true picture. So decisions are make with non-visible status.

Solution: VisibleAgile brings the status captured at source, aggregates at scale and makes the true and same picture visible to all. This can be done by accessing and aggregating the team's project management data from various tools like Jira, TFS, Ruby, VersionOne etc.,

Benefits: Achieving much needed transparency. This transparency brings a common language that can be shared by all participants. Those performing the work and those inspecting, share the common status. Therefore decisions are made on right status, right time and right people.
